

A Call for Authors

Advances and Applications in Biotechnology Series

Aim & Scope:

The book series "Advances and Applications in Biotechnology" is intended to outline the current status and the potential developments of biotechnology for several industrial and commercial sectors. Book volumes under the series will investigate the potential applications, the worldwide research and developments, as well as the difficulties and challenges of biotech processes, aiming to create a detailed prospect on the advances of biotechnology by analyzing several products and processes at different stages of development, from laboratory-research scale, the efforts to scale-up, and finally the wide field of applications into industrial scales. Also, this series will present the use and study of various biological organisms, specially aiming to explore in greater detail the potential of bacteria, fungi, yeasts, cell cultures, enzymes among several other biocatalyst and fermenting agents for biotechnological advances.

The series will be targeted at evaluating worldwide research, focused on the biotechnological advances for technological, economic, commercial and social relevance, for areas such as food, pharmaceutical, chemical and biofuel industries, besides developments in more sustainable chain-process, environments, agriculture, wastes valorization, bioremediation, biomedical, genomic techniques developments, the bioproduction of natural chemicals and biologically active compounds (e.g. bio colorants, biosurfactants, biopolymers, polysaccharides, organic acids, amino acids, vitamins, among others); among several other sector applications.

This book series will gather the most recent research and advances regarding the applications of biotechnology in food, pharmaceutical, chemical, biomedical and biofuel industries, and more.

Proposals may be submitted to:

Prof. Gustavo Molina, PhD.
Associate Professor
